The Basics

Introduction

ToDo++ is the to-do application of your choice. Take control of your life like never before, with keyboard shortcut keys and intuitive natural-language-like text commands. Personalize the way you want to interact with the app. Be alerted of your events, and never lose track of your tasks again.

At a Glance

Settings: Where you customize your keyboard shortcuts, command keywords and more

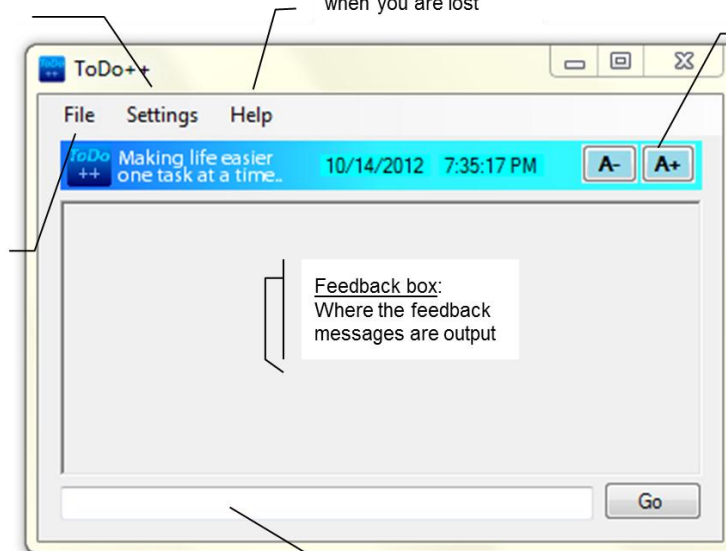

Help: Where you can find useful information when you are lost

Font size toggles: To increase or reduce the font size

File: Where you can export your tasks list to other file formats and customize your ToDo++ startup settings

Feedback box: Where the feedback messages are output

Input box: Where you enter your commands

Quick Start

Upon launching ToDo++, you are presented with a minimalistic and intuitive screen. All you have to do to start creating your list is to just start typing!

- Create your first task/event by typing the keyword “add” followed by your task/event name into the input box, followed by the event time or deadline if any.
- For example, to add your Mom’s birthday brunch this Sunday, simply type in “*add mom’s bday this sunday*”. Hit *Enter* and the item is added!
- To view what you have added, just key in “display” and your list, ordered by date and time (or however you have customized it in the Settings page), will be displayed!

Note: If you have a task/event name that includes a date, time, or keyword, such as ‘Thank God It’s Friday’ or ‘delete ex-girlfriend’s number’, use quotation mark or brackets around the task/event name to prevent ToDo++ from messing up your instruction.

You can search for, modify and delete your tasks from the list using these very words as the keywords. Alternative keywords can be found in the [Appendix](#).

Remember the order of what you enter does not matter! Take a look at section [4.1. FlexiCommands](#) to find out more and learn how to customize ToDo++ to your needs.

The following sections will describe basic ToDo++ operations in more detail.

Creating Your ToDo++ List

Types of Tasks

There are three basic types of tasks you can add to your list.

- Event tasks** : items that have a start time (and possibly an end time).
Deadline tasks : items that have to be done before a specific time.
Floating tasks : items that have no timings attached to them.

As always, there is no fixed way to add a certain type of task. Simply type in what makes sense to you, and ToDo++ will know what type of task to add! See the next section, “Adding an Item” for more information.

Basic Operation

The order of input of all required fields is flexible. Date input is context sensitive. For more information, please see section [4.1. FlexiCommands](#).

For a complete list of default keywords and more details on how to use bracketing, please see section [4.1.3 Using Reserved Keywords](#).

You can quickly undo a wrongly input command using the “undo” command. For more information, please see section [4.2.1 Undoing a Command](#).

The following sections detail the basic operations.

Adding a Task

Using the default `add` keyword, you can add all types of items to your list easily in a structured format similar to natural language. The task type will depend on the inclusion or omission of start/end times/deadlines. You can add your tasks in the following ways:

Adding a floating task	Enter “ <code>add [task name]</code> ” eg. add finish project
Adding an event (timed) task	Enter “ <code>add [task name] [start time] {end time} {day/date}</code> ” eg. add check todo++ in 2 hours eg. add max birthday 4pm tomorrow eg. add team meeting 2pm-4pm next wed
Adding a deadline item	Enter “ <code>add [task name] by [deadline]</code> ” eg. add do cs2103 CE2 by saturday midnight

Note: Optional keywords are in curly braces. See [Appendix](#) for a full list of keywords and defaults.

Searching & Viewing

Using the default `display` keyword, you can search, filter and view your list of to-do items. ToDo++ has a powerful sort and search algorithm that will help you find your tasks with intuitive commands in consummate ease.

A search request may be made up of more than one search requirement. Below are examples of how you can use this feature to its full potential. Optional commands are in curly braces.

Display all tasks	Enter " <code>display</code> "
Search for and display all or some of the tasks scheduled on, before or, after a specific day or date	Enter " <code>display [day/date]{before/after}{time}</code> " eg. <code>display 06/09/2012</code> eg. <code>display Sunday after 1500hrs</code> eg. <code>display 6 sept before 10pm</code> eg. <code>display next Saturday</code> eg. <code>display tomorrow</code>
Search for and display tasks by task names or descriptions	Enter " <code>display [name]</code> " eg. <code>display buy milk</code>

Note: Optional keywords are in curly braces. See Appendix for a full list of keywords and defaults.

Search results will be displayed in the feedback window as an indexed list. Each task will be given a numbered ID for easy reference. From here, you can do further operations, such as modifying or deleting an item. See the following sections for more information.

Updating & Modifying

Using the default `modify` keyword, you can easily modify and edit your task details. For example, you may wish to change the scheduled date for a task or rename it to correct a typographical error.

Note that in order to modify a task name, you must first call for the task by its name and then modify it by calling its reference index. The input should not contain any date/time input. Otherwise, it will be regarded as a request to modify the task's start/end times/deadlines.

Modifying task name	Enter " <code>modify [task index] [new name]</code> " eg, (User) <code>modify milk</code> (ToDo++) 1. milk Stevv for more info 2. buy more milk (User) <code>modify 1 milk Steve for more info</code>
Modifying task time	Enter " <code>modify [task index] [new start time/deadline] {end time} {day/date}</code> " eg. <code>modify visit the vet Sunday</code> eg, (User) <code>modify buy car tomorrow</code> (ToDo++) 1. buy toy car on sunday 2. buy car parking coupon today (User) <code>modify 2 tomorrow</code>

Note: Optional keywords are in curly braces. See Appendix for a full list of keywords and defaults.

Removing a Task

Using the default `delete` or `-remove` keyword, you can remove previously added tasks from your ToDo++ list. You can call for a task and delete it in the 2 following ways:

By task name Call the task by its name.

Note that if more than one task matches the input name, all matching tasks will be reflected in the feedback window. Each task will be given a numbered index for easy reference.

By task index Call the task by its given index, as displayed in the feedback window (as above).

Deleting a single task	Enter " <code>delete/-remove [task name/index]</code> " eg. <code>delete 3</code> eg, <i>(User)</i> <code>delete milk</code> <i>(ToDo++)</i> 1. milk Steven for more info 2. buy more milk <i>(User)</i> <code>delete 2</code>
Deleting all or some of the tasks scheduled on, before or, after a specific day/date	Enter " <code>delete/-remove [day/date] {before/after} {time}</code> " eg. <code>delete today</code> eg. <code>-remove Sunday after 1500 hours</code> eg. <code>delete 31 december after 10pm</code>

Note: Optional keywords are in curly braces. See Appendix for a full list of keywords and defaults.

Moving Your List

Loading & Saving Your ToDo++ List

By default, when ToDo++ is run for the first time, a new list is created and saved in default.todo.xml file, which can be located in the same directory. Subsequently, whenever ToDo++ is run, this file will be automatically loaded to retrieve the list in its latest state.

Note that manual saving is not required as the file is written to immediately after each command.

Exporting Your ToDo++ List

To export and save your list in a different format such as a .txt text file, or for Google Calendar, select File > Export To option in the menu bar.

Advanced Features

FlexiCommands

ToDo++ is an intelligent software that allows you to input commands in a way that is natural to you. Your input is therefore not case sensitive and not order specific. What this means is that the following commands are both equivalent and valid!

add max's birthday 25th oct	add 25/10 max's birthday
add movie outing 3pm to 5pm today	add 3pm-5pm movie outing today
display tomorrow after 7pm	display after 7pm tomorrow
delete after 4pm 6 december	remove 6/12 after 4pm

Custom Keywords

ToDo++ is a to-do list made to be familiar and intuitive to the individual user. We realize that you may not want to use the default keywords for your commands and have allowed for you to set custom keywords for the various basic operations. You can find this under Settings > Custom Keywords in the menu bar.

Using Reserved Keywords

There may be times when you wish to use a keyword within an event name. Simply enclose your event name within any of the following delimiters to do so.

- Quotation marks
 - add "add girl on facebook"
 - remove 'delete error'
- Brackets/Braces
 - modify 2 {reserve dinner for 3}
 - add (go to 2am Bar) 2am tomorrow
 - display [21st birthday]

As shown above, the same goes for days, dates and times. For operations where indexing is possible (i.e. modify, delete), floating numbers should also be enclosed in delimiters.

Important Features for Power Users

Undoing a Command

In order to undo a mistyped command, simply enter undo to revert to the state before the last entered command. Alternatively, you can also use the *ALT-Z* keyboard shortcut.

Minimizing to TaskBar

Simply enter hide to minimize the ToDo++ window to the system tray. You will still be able to see its icon in the taskbar notification area while it runs in the background.

To restore the ToDo++ window, simply double-click on the icon or right-click and select *Restore*. Alternatively, you can use the *ALT-Q* keyboard shortcut to toggle between the minimized and restored states.

Icon minimized to notification area

Autorun

You can get ToDo++ to run automatically on Windows startup by simply checking the File > Load on Startup option in the menu bar. Additionally, you can also check File > Start Minimized if you wish for ToDo++ to start running in the minimized state.

Hotkeys

Keyboard shortcuts can be changed and customized under Settings > Hotkeys in the GUI menu ribbon. A list of default hotkeys can be found in the Appendix.

Appendix

Note: Optional keywords are in {curly braces}. Inputs in [square brackets] must be valid in order for the keywords to work.

COMMAND KEYWORDS

ADD: add, -new

SEARCH/VIEW: display, view, search

MODIFY: modify, -update

DELETE: delete, -remove

UNDO: undo

LOAD: -load

EXPORT: -export

MINIMIZE: -min

ADD FUNCTION KEYWORDS

DAY: mon, monday, tues, tuesday, wed, wednesday, thurs, thursday, fri, friday, sat, saturday, sun, sunday, today, tomorrow

MONTH: jan, feb, mar, apr, may, jun, jul, aug, sep, sept, oct, nov, dec, january, february, march, april, may, june, july, august, september, october, november, december

DATE: [1-31]{st/nd/rd/th}{MONTH} {valid year}

** date must be in the future to be valid*

TIME: [1-12] am/pm, [0000-2359] hrs/hours

** spaces are optional*

CONDITIONAL ADJECTIVES: [next/following] [DAY/MONTH]

SIGNIFY EVENT (TIMED) TASK: {from} [DATE/DAY/TIME] {– / to} {DATE/DAY/TIME}

** omission of time/month keyword for start time is valid as long as it is present in the end time (e.g. 2-4pm)*

SIGNIFY DEADLINE TASK: by [DATE/DAY/TIME]

ADD FUNCTION DEFAULT BEHAVIOR

- Not specifying any fields in date or time will cause the software to assume the most upcoming date which fits the entered fields. For example, "add event 2nd" will set the event to be on 2nd October if today's date is 3rd September but 2nd September if today's date is 1st September.
- The valid partial date inputs include inputs consisting of only the
 - (1) day with suffixes i.e. 15th
 - (2) day and month i.e. 15/10
 - (3) month and year i.e. 10/2012 (requires full year input of YYYY)
- Not specifying the **by** keyword will create an event (timed) task instead of a deadline task if only one date/time is specified. The date/time specified will be the event's start time.
- Omission of both time and month keyword when creating event task will cause ToDo++ to assume that the numbers refer to month by default.

SEARCH/VIEW FUNCTION KEYWORDS

DAY/MONTH/DATE/TIME: *same as ADD. see above*

DISPLAYING BY EVENT/DEADLINE TIMES: *same as ADD. see above.*

INDEX: all integer numbers are reserved if and only if the previous command caused indexed results to be displayed

SEARCH/VIEW FUNCTION DEFAULT BEHAVIOR

- All possible results will be displayed when keywords are omitted. For more specific results, try to enter a more specific search string.
- When searching by date or day, as long as the specified search date or day falls within the time window of an event task, the event task will also be displayed as a search result.

MODIFY FUNCTION KEYWORDS

DAY/MONTH/DATE/TIME: *same as ADD. see above*

MODIFYING EVENT/DEADLINE TIMES: *same as ADD. see above.*

INDEX: all integer numbers are reserved if and only if the previous command caused indexed results to be displayed

MODIFY FUNCTION DEFAULT BEHAVIOR

- When the modify operation is called with an input that includes a date/day/time, it will be automatically considered to be a request for modification of the start/end times/deadline of the relevant task. If there is only one task found to match the input, its start/end times/deadline will thus be automatically modified. Otherwise, the modify operation functions like a search/view operation and returns a list of matching hits.
- In order to modify a task name, the task must be called by its index. Otherwise, the request will not be recognized.

DELETE FUNCTION KEYWORDS

DAY/MONTH/DATE/TIME: *same as ADD. see above*

INDEX: all integer numbers are reserved if and only if the previous command caused indexed results to be displayed

DELETE FUNCTION DEFAULT BEHAVIOR

- When more than one task in the list is found to match the input, the delete operation functions like a search/view operation and returns a list of matching hits.

An Overview

Where We Are Now

Must-have Features

Most of the must-have features have been implemented and verified to be working in good order. The CRUD (create/add, read/display, update/modify, delete) tasks support is available and a simple search is also possible using the display command.

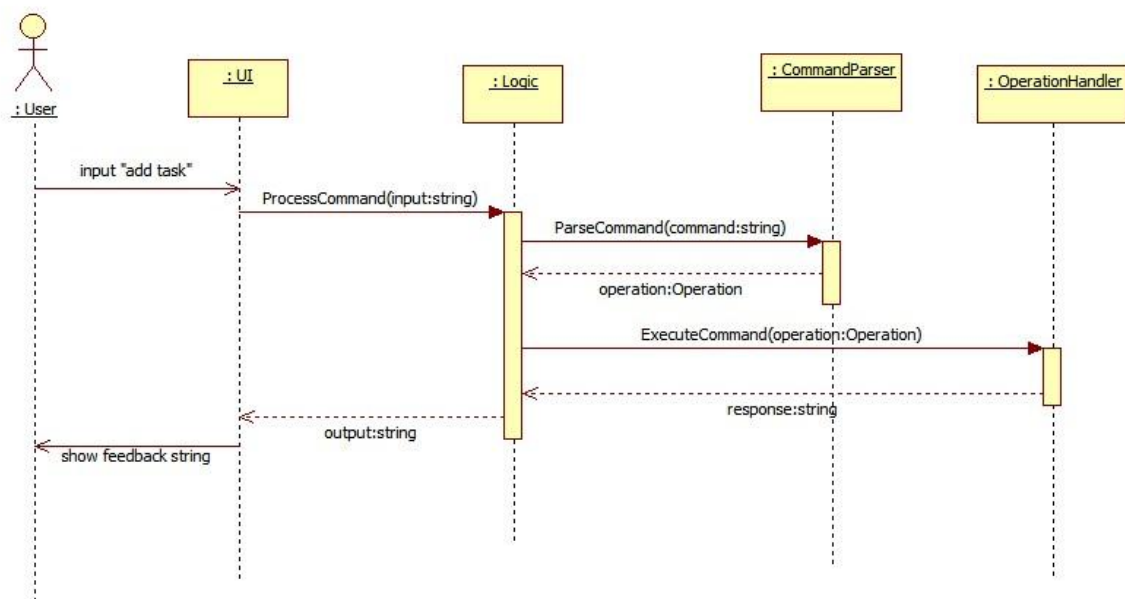

Extra Feature

The focus good-to-have feature FlexiCommand has been more or less fully implemented but may require additional refinement to ensure full working functionality and catch exceptions. A simple GUI has also been implemented such that keyboard shortcuts/hotkeys and user customization of command keywords and shortcuts are also available.

Class Diagram

[diagram]

User Sequences Diagram

General Class Descriptions

Important Attributes	
Variable	Description
enum CommandType	Enumerates the various command types (add, delete, display, sort, search, modify, undo, redo, invalid)
enum ContextType	Enumerates the various context types (starttime, endtime, deadline, current, next, following)
enum Month	Enumerates the 12 months, starting from index 1 (jan, feb, mar, apr, may, jun, jul, aug, sep, oct, nov, dec)

Main Class	
Class	Description
Program (static)	The main entry point for the application

User Interface Classes	
Class	Description
UI	Takes in all user input Displays returned feedback
Menu	Displays the menu strip and handles all things related
SettingsUI	Handles the display of the settings menus and takes in the settings changes
Settings	Takes in and implements the settings

Logic Class	
Class	Description
Logic	Takes in and processes user input Executes the command Returns feedback

Parser Classes	
Class	Description
CommandParser	Takes in and parses command string Returns an Operation object
StringParser	Takes in and parses the command string into tokens Returns a List of generated Tokens

Token Classes	
Class	Description
Token (abstract)	An abstract class from which all the other Token classes inherit from
TokenCommand : Token	Stores the details pertaining to the command information of a

	task
TokenDate : Token	Stores the details pertaining to the date information of a task
TokenTime : Token	Stores the details pertaining to the time information of a task
TokenDay : Token	Stores the details pertaining to the day information of a task
TokenContext : Token	Stores the details pertaining to the context information of a task
TokenLiteral : Token	Stores the details pertaining to the literal information of a task

Storage Class

Class	Description
Storage	Handles the storage of tasks information Takes in a Task object and writes it to an XML file

Task Classes

Class	Description
Task (abstract)	An abstract class from which all the other Task classes inherit from
TaskFloating : Task	Stores the task details of a floating task
TaskDeadline : Task	Stores the task details of a deadline task
TaskEvent : Task	Stores the task details of an event (timed) task

Operation Classes

Class	Description
Operation (abstract)	An abstract class from which all the other Operation classes inherit from
OperationAdd : Operation	Stores the operation details for an add operation
OperationDelete : Operation	Stores the operation details for a delete operation
OperationDisplay : Operation *	Stores the operation details for a display operation
OperationSearch : Operation	Stores the operation details for a search operation
OperationModify : Operation	Stores the operation details for a modify operation
OperationUndo : Operation	Stores the operation details for an undo operation
OperationHandler	Takes in an Operation object and executes it by calling the relevant methods

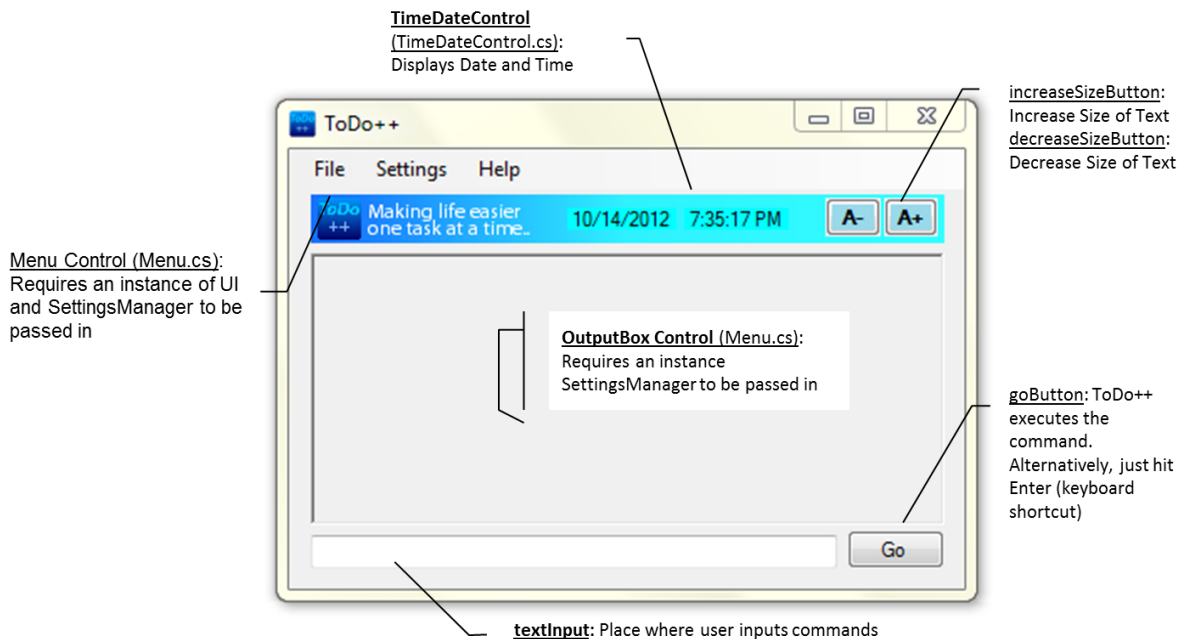

* not yet implemented / only partially implemented

User Interface Classes

UI

Summary

High-level class that handles all the user interaction and allows access to the customization settings menus, displays feedback and calls on the other classes to handle the command processing

Detailed Description

Provides the method for user customization of keyboard shortcuts
Handles all direction interaction with the user

Methods: PrepareSystemTray, PrepareSettingsManager, PrepareMenu, PrepareOutputBox, PrepareLogic, MinimiseMaximiseTray, RegisterInStartup, MinimiseToTrayWhenChecked, RegisterLoadOnStartupWhenChecked, ProcessText, *ProcessCmdKey*

Test History

Some testing has been done with regards to the testing user interaction (testing of hotkeys, keyboard shortcuts, user customized settings etc) with little overall system testing (testing of input and feedback etc).

Important Attributes

Variable	Description
Hotkeys.GlobalHotKey ghk;	Global Hotkey to minimize to the system tray

SettingsManagers mainSettingsManager;	Instance of SettingsManagers that stores all settings data, including the user customized commands (FlexiCommands)
Logic logic;	Instance of Logic that handles the data structure and file operations; needed for use by text processing

Constructor

UI();	Calls the PrepareSystemTray, PrepareSettingsManager, PrepareMenu, PrepareOutputBox and PrepareLogic methods, which loads the minimization code, initial settings, menu strip and output box respectively
-------	--

Important API (Private Methods)

Method	Description
void PrepareSystemTray();	Registers the hotkey (Alt+Q) to be used for minimizing/maximizing to/from System Tray
void PrepareSettingsManager();	Creates an Instance of Settings Manager
void PrepareMenu();	Prepares the menu bar by passing in an instance of SettingsManager and loading the relevant settings
void PrepareOutputBox();	Prepares the output box by passing in an instance of SettingsManager and loading the relevant settings
void PrepareSettingsManager();	Creates an Instance of Logic
void MinimizeMaximizeTray();	Minimize/Maximizes ToDo++ from system tray
void RegisterInStartup(bool isChecked);	Detects the user setting and determines if ToDo++ is to be open at startup or not

Important API (Protected Method)

Method	Description
override bool ProcessCmdKey(ref Message msg, Keys keyData)	Processes the user customized keyboard shortcut to override the default/current keyboard shortcuts Takes note that ALT+Q is reserved for minimization

SettingsUI

Summary

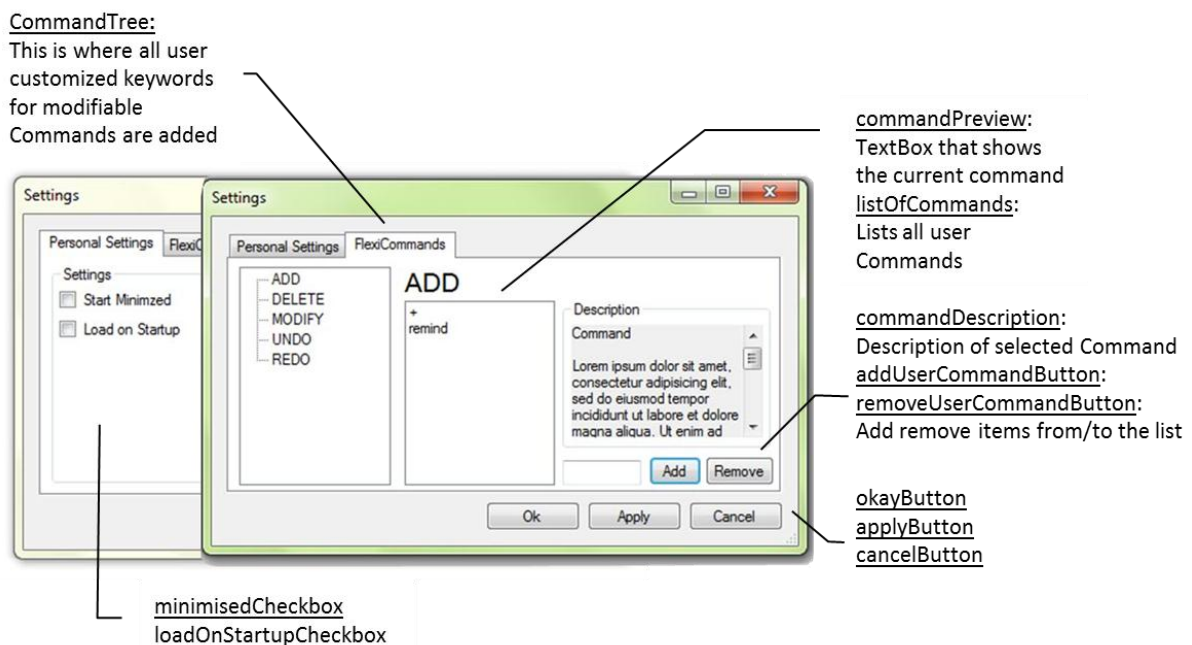

The class that handles the input of all user settings changes/modifications regarding ToDo++ Startup options and user customized command keywords (FlexiCommands) and calls on the Settings class to implement and store the user defined settings

Detailed Description

Methods: **LoadPersonalSettingsTab**, **LoadFlexiCommandTab**

Test History

Testing has been done to verify that the user is able to customize and define additional command keywords and start ToDo++ on Startup minimized.

Important Attributes

Variable	Description
Settings settings;	Contains the instance of settings passed in
CommandType currentCommand;	Specifies the type of command that is currently selected
Settings tempSettings;	Temporary copy of the user defined settings during customization that are copied from when Apply or OK are hit

Important API (Public Methods)

Method	Description
void LoadPersonalSettingsTab();	Loads the Personal Settings Tab

<code>void LoadFlexiCommandTab();</code>	Loads the Flexi Commands Tab
--	------------------------------

Settings

Summary

The class that implements, stores and manages all user defined settings

Detailed Description

Stores the following public attributes: booleans `loadOnStartup` and `startMinimized`, integer `textSize`, Lists of Strings `customKeywords_ADD`, `customKeywords_DELETE`, `customKeywords_MODIFY`, `customKeywords_UNDO` and `customKeywords_REDO`

Provides the methods to change the font size

Provides the methods to add and remove user defined command keywords

Methods: **SetTextSize**, **GetTextSize**, **IncreaseTextSize**, **DecreaseTextSize**, **AddCommand**, **RemoveCommand**, **GetCommandList**, **AddCommandsToStringParser**, **OpenFile**, **WriteToFile**, **CopyUpdatedCommandsFrom**, **CloneObj**

Test History

Testing has been done to verify that the user is able to customize and define additional command keywords and start ToDo++ on Startup minimized.

Important API (Public Methods)	
Method	Description
<code>List<string></code> <code>GetCommandList(CommandType</code> <code>commandType);</code>	Returns a list of all added/available user commands
<code>void AddCommandsToStringParser();</code>	Pushes new set of FlexiCommands into the StringParser
<code>void</code> <code>CopyUpdatedCommandsFrom(Settings</code> <code>passedSettings);</code>	Copies the new user defined command keywords from a copy of the stored temporary settings
<code>Settings CloneObj();</code>	Clones an instance of Settings (deep copy)

Logic Class

Summary

High-level class that calls the other appropriate class methods to process and execute the commands as well as update the settings; where the user input is passed in and processed

Detailed Description

Provides the methods for processing and executing the commands

Provides the methods for calling the command parser to parse the commands and for calling the operation handler to execute the commands

Provides the method to update settings *

Methods: **ProcessCommand**, **UpdateSettings ***, **ExecuteCommand**, ParseCommand

Test History

No testing has been done for the Logic class as yet.

Important API (Public Methods)	
Method	Description
string ProcessCommand (string input);	Processes (parses and executes) the command passed in by the UI Return feedback string to the UI.

Parser Classes

CommandParser

Summary

Calls the parsing methods to make sense of the command string and create the relevant operation object

Detailed Description

Provides the method to parse the command string into tokens and then generate an operation object containing the relevant task object based on these tokens

Methods: **ParseOperation**, GenerateOperation, CreateOperation *, CombineDateAndTime, GenerateNewTask, GetDateFromDay, GetDaysToAdd, WarnUsersOfMultipleCommands, GetPositionsOfDelimiters, RemoveBadIndexes, SortIndexes, CompareBasedOnZerothIndex

Test History

Black box testing has been employed in setting up test methods to test and validate ParseOperation method. The various following situations/cases have been tested: addition of valid deadline task, addition of invalid task, addition of valid timed event task with only one single specified start time, addition of valid timed event task with both start and end times specified.

Important API (Public Method)	
Method	Description
Operation ParseCommand (string input);	High-level method that first calls the GetPositionsOfDelimiters method, then an instance of StringParser to parse the string into tokens and finally, the GenerateOperation method

Important API (Private Methods)	
Method	Description
Operation GenerateOperation (List<Tokens> tokens);	Takes in a List of Tokens and generate an operation based on the tokens
Operation CreateOperation (CommandType commandType, ...);	Create operation based on derived values and whether they have been used by creating the relevant Task and adding it to an instance of the relevant Operation class
DateTime? CombineDateAndTime (string taskName, ...);	Returns a combined DateTime consisting of date and time inputs If only the time is defined, the DateTime returned is specified to be tomorrow If only the date is defined, the default DateTime constructed is returned
Task GenerateNewTask	Creates and returns the new relevant Task object based on the

(string taskName, ...);	input startTime and endTime, which are optional
DateTime GetDateFromDay (...);	Takes in a day of the week and returns the corresponding date depending on what the preposition is
int GetDaysToAdd (...);	Calculates the number of days to add to the given day of the week in order to return the next occurrence of the desired day of the week.
int[] GetPositionsOfDelimiters (string input);	Combs the input string for all delimiters Returns the positions of all matching delimiters
void RemoveBadIndexes(ref List<int[]> indexOfDelimiters);	Checks each pair of indexes removes those that overlaps with the previous pair

StringParser

Summary

The class that does most of the actual command parsing

Detailed Description

Provides the method for thorough command parsing and the generation of tokens, which are then subsequently used to create the actual task object in the CommandParser class
Provides the method for addition of user customized keywords

Stores CommandType enum, ContextType enum, Month enum, delimitingCharacters, commandKeywords Dictionary, contextKeywords Dictionary, dayKeywords Dictionary, monthKeywords Dictionary, timeSpecificKeywords Dictionary, timeGeneralKeywords Dictionary, timeSuffixes Dictionary and regexes (see Attributes)

Methods: **StringParser**, AddUserCommand, ResetCommandKeywords, FindPositionOfDelimiters, ParseStringIntoTokens, SplitStringIntoSubstrings, MergeCommandAndIndexKeywords, MergeDateAndTimeWords, MergeTimeWords, MergeWord_IfValidTime, MergeDateWords, MergeWord_IfValidAlphabeticDate, GenerateTokens, GenerateCommandTokens, GenerateDayTokens, GenerateDateTokens, GetDateMatch, GetMatchTagValues, ConvertMatchTagValuesToInts, ConvertToNumericMonth, RemoveSuffixesIfRequired, GenerateTimeTokens, GenerateContextTokens, GenerateLiteralTokens, AddLiteralToken, CompareByPosition, IsValidTime, IsValidNumericDate, IsValidAlphabeticDate, IsValidDate, GetTokenAtPosition

Test History

White box testing has been employed in setting up test methods to test and validate all date and time parsing methods (MergeDateWords, MergeWord_IfValidAlphabeticDate, GenerateDateTokens etc.), including the testing of all the date and time regexes.

Invalid date inputs such as 31 Feb are currently just ignored; they do not flag or call exceptions to notify the user of the erroneous date input.

Important Attributes	
Variable	Description
char[] delimitingCharacters	Specifies all delimiting characters ([,], (,), {, }, ', ")
Dictionary<string, CommandType> commandKeywords	Specifies the relevant strings to be the keys for various relevant CommandTypes i.e. add, delete etc.
Dictionary<string, ContextType> contextKeywords	Specifies the relevant strings to be the keys for the various ContextTypes i.e. by, on, from etc.
Dictionary<string, DayOfWeek> dayKeywords	Specifies the relevant strings to be the keys for the various DayOfWeeks i.e. mon, monday, tues, weekend etc.

Dictionary<string, Month> monthKeywords	Specifies the relevant strings to the keys for the various Months i.e. jan, january, feb, february etc.
Regex time_24HourFormat	Find all time inputs in the 24 hour format
Regex time_12HourFormat	Find all time inputs in the 12 hour format
Regex date_numericFormat	Find all date inputs in the numeric format i.e. DD/MM/YYYY, MM/DD/YYYY
Regex date_alphabeticFormat	Find all date inputs in the numeric format i.e. DD/MMM/YYYY, MMM/DD/YYYY
Regex date_daysWithSuffixes	Find all date inputs that only consist of days with suffixes

Constructor

StringParser();	Calls the InitializeDefaultKeywords method (see below)
-----------------	--

Initialization Methods

Method	Description
void InitializeDefaultKeywords ();	Calls all the other initialization methods
void InitializeCommandKeywords ();	Sets up the commandKeywords Dictionary
void InitializeDateTimeKeywords ();	Sets up the dayKeywords Dictionary Creates String Lists storing time specific keywords, time general keywords and time suffixes
void InitializeMonthKeywords ();	Sets up the monthKeywords Dictionary
void InitializeContextKeywords ();	Sets up the contextKeywords Dictionary

Important API (Internal Methods)

Method	Description
void AddUserCommand (string userCommand, CommandType commandType)	Adds a user defined/customized keyword to the list of default operation keywords
List<int[]> FindPositionsOfDelimiters (string input);	Searches the input string against the set delimiters' and return the positions of the delimiters as a list of integer pairs
List<Token> ParseStringIntoTokens (string input. List<int[]> = null);	Parses a string of words into a list of tokens, each containing a token representing the meaning of each word or substring By inputting a list of integer pairs to mark delimiting characters, multiple words can be taken as a single absolute substring (word).

Important API (Private Methods)

Methods	Description
---------	-------------

<code>List<string> SplitStringIntoSubstrings (string input, List<int[]> indexOfDelimiters);</code>	Splits a string and returns a list of substrings, each containing either a word delimited by a space, or a substring delimited by positions in the parameter <code>indexOfDelimiters</code>
<code>List<string> MergeCommandAndIndexKeywords (List<string> words);</code>	Checks to see if the command is followed by an index and if positive, merges the command with the index
<code>List<string> MergeDateAndTimeKeywords (List<string> words);</code>	Detects and merges all the date and time words into a single string while keeping the other words separate and unmerged by calling the <code>MergeTimeWords</code> and <code>MergeDateWords</code> methods i.e. input "add", "task", "friday", "5", "pm", "28", "sept", "2012" returns "add", "task", "friday", "5pm", "28 sept 2012"
<code>bool MergeWord_IfValidTime (ref List<string> output, List<string> input, int position);</code>	Checks if the indicated word in a list of string is part of a time phrase and if positive, merges it with the other words constituting the time phrase into one string
<code>bool MergeWord_IfValidAlphabeticDate(ref List<string> output, List<string> input, int position, ...);</code>	Checks if the indicated word in a list of string is part of an alphabetic date phrase and if positive, merges it with the other words constituting the date phrase into one string
<code>List<Token> GenerateTokens(List<string> input);</code>	Searches an input list of strings and generates the relevant command, day, date, time, context and literal tokens of all the relevant matching strings by calling the various token generation methods <code>GenerateCommandTokens</code> , <code>GenerateDayTokens</code> , <code>GenerateDateTokens</code> , <code>GenerateTimeTokens</code> , <code>GenerateContextTokens</code> , <code>GenerateLiteralTokens</code> Returns a sorted list of the generated Tokens

Token Classes

Token

Summary

Abstract class that cannot be instantiated

Subclasses: TokenCommand, TokenDate, TokenTime, TokenDay, TokenContext, TokenLiteral

The various token objects from the different subclasses are differentiated with the attribute type.

Detailed Description

Enumerates the various token types, which have differing storage details information of tokens according to the type. All subclasses inherit the attributes position and type.

Each subclass object stores the details of a relevant task.

For example, a TokenCommand object stores the details pertaining to the command information of a task an operation is to execute.

Test History

No testing has been done for the Token class and subclasses as yet.

Important Attributes	
Variable	Description
enum TokenType	Enumerates the various token types (command, date, time, day, context, literal)
int position	Stores the index of the token in the input List of Strings
TokenType type	Stores the token type

TokenCommand : Token

Constructor	
TokenCommand(int position, CommandType val, int taskIndex = 0) : base(position)	Sets the command type, token index and task index (The task index will be the same for all tokens generated for the same task)

Important API (Internal Methods)	
Method	Description
CommandType Value	Getter method retrieves the command type stored
int TaskIndex	Getter method retrieves the task index

TokenDate : Token

Constructor	
TokenDate(int position, DateTime date, Boolean specific_flag) : base(position)	Sets the date value, information regarding the date specificity and token index
Important API (Internal Methods)	
Method	Description
DateTime Value	Getter method retrieves the date information stored
bool IsSpecific	Getter method retrieves the specificity information of the stored date

TokenTime : Token

Constructor	
TokenTime(int position, TimeSpan val) : base(position)	Sets the time value and token index
Important API (Internal Methods)	
Method	Description
TimeSpan Value	Getter method retrieves the time information stored

TokenDay : Token

Constructor	
TokenDay(int position, DayOfWeek val) : base(position)	Sets the day value and token index
Important API (Internal Methods)	
Method	Description
DayOfWeek Value	Getter method retrieves the day information stored

TokenContext : Token

Constructor	
TokenContext(int position, ContextType val) : base(position)	Sets the context type and token index

Important API (Internal Methods)	
Method	Description
ContextType Value	Getter method retrieves the context type stored

TokenLiteral : Token

Constructor
TokenLiteral(int position, string val) : base(position))

Important API (Internal Methods)	
Method	Description
string Value	Getter method retrieves the literal information stored

Storage Class

Summary

The class that handles the storage and retrieval of tasks information

Detailed Description

Provides the method for writing of tasks information to an XML file for storage

For floating tasks, only the task name will be recorded and stored

For deadline and event (timed) tasks, both the task name and relevant specified time information will be recorded and stored

Methods: **WriteXML**, AddTask *, RemoveTask *

Test History

Some testing has been done to verify that the tasks information can be successfully written in a fixed formatting to a standard XML file.

Constructor	
Storage();	No argument is needed

Important API (Public Method)	
Method	Description
bool WriteXML(Task task);	Writes task information to an XML file Returns true if writing process succeeded and false if otherwise

Task Classes

Task

Abstract class that cannot be instantiated

Subclasses: TaskFloating, TaskDeadline, TaskEvent

Detailed Description

All subclasses inherit the attribute taskname.

Each subclass object stores the details of a relevant task.

For example, an TaskFloating object stores the details of a floating task that has no date and time specification.

Test History

No testing has been done for the Task class and subclasses as yet.

Important Attribute	
Variable	Description
string taskname	Stores the name of the task

TaskFloating : Task

Constructors	
TaskFloating();	Default constructor that requires no argument
TaskFloating(string TaskName);	Sets name of task as TaskName

TaskDeadline : Task

Constructors	
TaskDeadline();	Default constructor that requires no argument
TaskDeadline(string TaskName, DateTime EndTime)	Sets name of task as TaskName and task deadline as EndTime.

TaskEvent : Task

Constructors	
TaskDeadline();	Default constructor that requires no argument
TaskDeadline(string TaskName, DateTime StartTime, DateTime EndTime)	Sets name of task as TaskName, starting time of the task as StartTime and ending time of the task as EndTime, thereby

EndTime)	specified the time range of the event (timed) task
----------	--

Operation Classes

Operation

Summary

Abstract class that cannot be instantiated

Subclasses: OperationAdd, OperationDelete, OperationDisplay, OperationSearch, OperationModify, OperationUndo

Detailed Description

Each subclass object stores the details of a relevant operation to be executed. For example, an OperationAdd object stores the details of the new task to be added in a Task object.

Test History

The various operation subclasses have been validated by the verification of the ParseOperation method as auxilliary storage objects used in the testing methods.

OperationAdd : Operation

Constructor	
OperationAdd(Task setTask);	Sets the new task to be setTask

OperationDelete : Operation

Constructor	
OperationDelete(int index);	Stores the index of the task to be deleted in index

OperationSearch : Operation

Constructor	
OperationSearch(string searchString);	Sets the search string to be searchString By default, the stored search string is an empty string

OperationModify : Operation

Constructor	
OperationModify(int Previous, Task Revised);	Stores the previous task index in oldTaskIndex and the new revised task in newTask

OperationHandler

Summary

The class that handles the operations execution

Detailed Description

Provides the method for operation execution given an Operation object

Stores feedback strings

Creates and stores lastListedTask (list of Task objects), undoStack (stack of Operation objects and storageXML (Storage object)

Methods: **OperationHandler**, **Execute**, Add, Delete, DisplayAll, TrackOperation

Important Attributes	
Variable	Description
List<Task> lastListedTasks;	List of the most recent tasks for ready retrieval when required
Stack<Operation> undoStack;	Stack of Operation objects that store the latest executed operations for ready retrieval when user chooses to undo an operation
Stack<Operation> redoStack;	Stack of Operation objects that store the undone operations for ready retrieval when user chooses to redo an operation
Storage storageXML;	An instance of storage

Constructor	
OperationHandler();	Creates a List of Tasks, Stack of Operations and an instance of Storage

Important API (Public Methods)	
Method	Description
string Execute(Operation operation, ref List<Task> taskList)	Processes command from UI Returns the feedback string
